

Q1: About data for AI

Instructions: Give your answers in bullet points.

a) What is open data? Given an example of open data that you produce which others can use?

- Open data is open to everyone to access, change and share
- If I put online, data that I collected about the outside temperature per hour for 7 days in Camden.
- Anyone could freely use it, change it or share it

b) You are analyzing a dataset, and some attributes are missing.

b.1) What could be any 2 reasons why they are missing?

- This could be something that was skipped
- Might not be available

b.2) What are any 2 ways you can still proceed with data analysis despite the missing values. For each, mention

what assumption you are making and what are its risks.

- You could delete it along with its other information
 - Could risk losing important data or changing bias of large scope of the data
- You could fill in the missing data with the mean based on other data in the set
 - You could risk bias or possible patterns in the data
